Description

Publication date: 28 September 2026

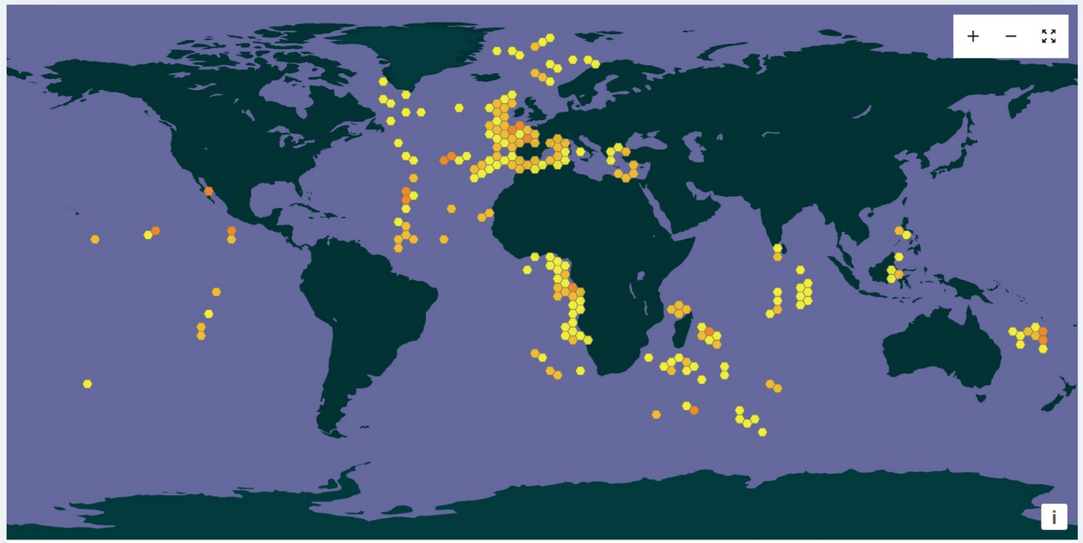

Network: Ocean Biodiversity Information System (OBIS)

Description of biological samples collected during deep-sea campaigns operated by the French oceanographic fleet since 2011. These data are acquired by underwater devices during the campaigns and then stored by Ifremer's CNDO (Centre National de Donnees Oceanographiques) Sismer. These data are mainly located in the Mid-Atlantic Ridge and around mainland France.

ABSTRACT

Aim

Understanding how ecological niches evolve is crucial for predicting species' responses to environmental change. Cephalopods, particularly those in the Octopodidae family, offer a compelling model system due to their short life spans, phenotypic plasticity and divergent developmental modes. We examined the evolutionary dynamics of the fundamental niche (FN) in Octopodidae by assessing niche overlap among closely related species pairs, quantifying phylogenetic niche conservatism (PNC) for temperature and dissolved oxygen, and evaluating phylogenetic signal and best-fitting evolutionary models across the family.

Query Rerun query

The predicate is too complex to be converted to regular filters in the UI. This also happens if the original download used a checklist that is no longer used. Instead it will show as a Complex Query that can be edited as JSON.

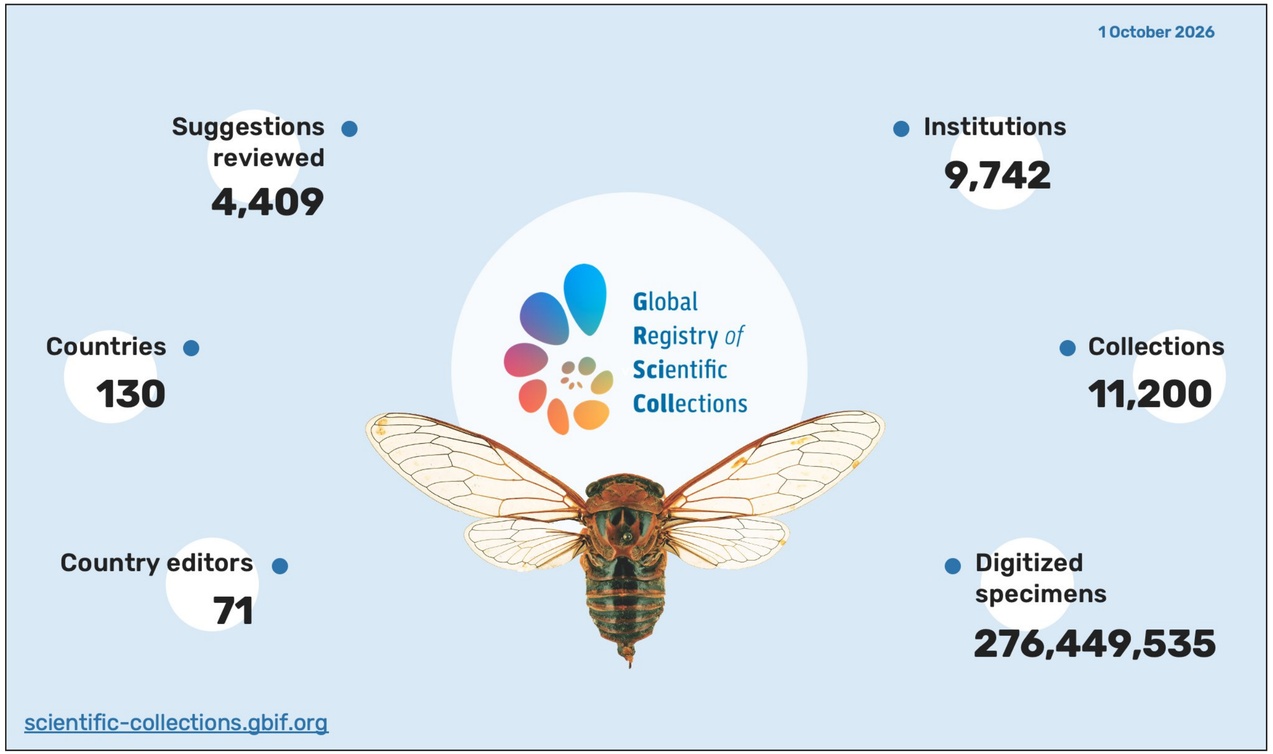

API

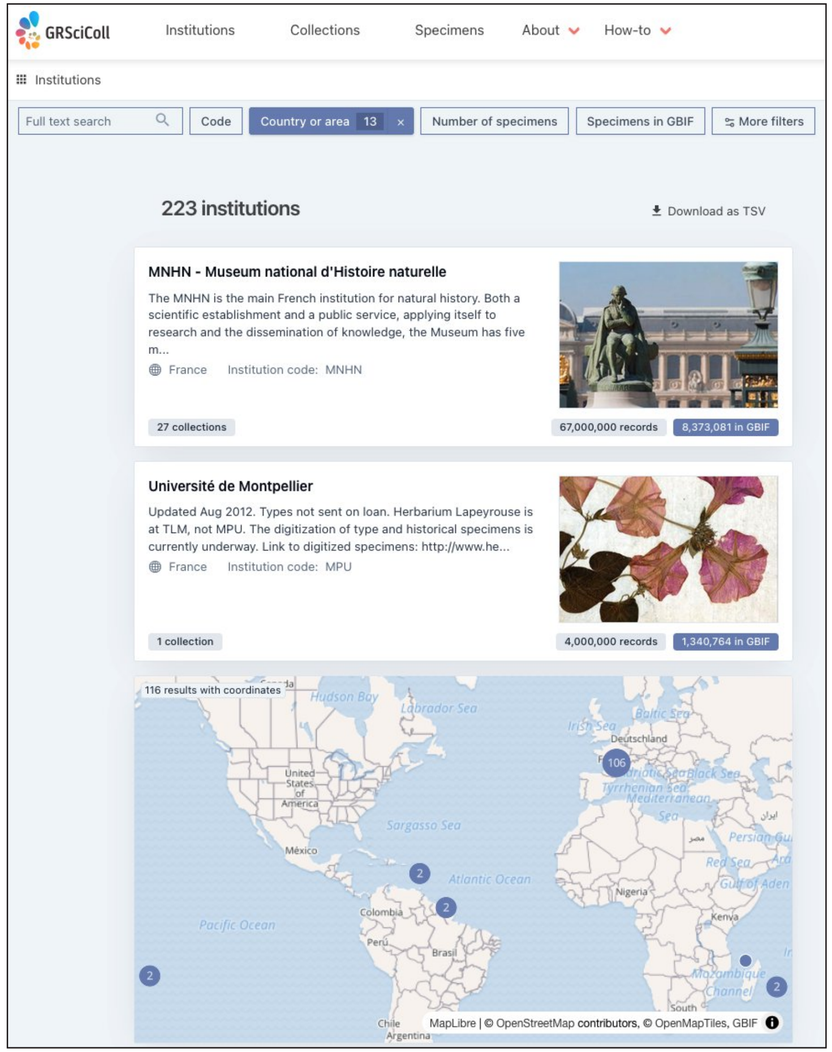

Showing this query in a readable form would require 61 label lookups, exceeding the limit of 50. To reduce load on our services, it is shown as raw JSON instead.

DwC Humboldt Extension: Surveys and Monitoring Data

Humboldt Extension

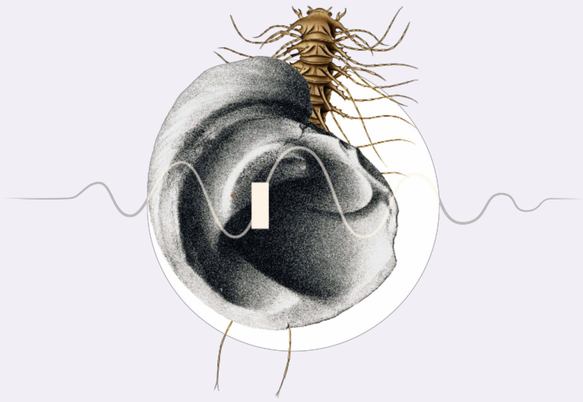

This task group explored concepts and methods of species inventories to fully integrate this type of observational data into existing data exchange schemas. To support proper capture of key information about inventories, current Humboldt extension terms (Guralnick et al. 2018) were reviewed, revised as necessary, and integrated into an extension of the Darwin Core. The TDWG Executive Committee ratified the Humboldt Extension on 2024-02-28. The resulting terms have been incorporated into the Darwin Core and can be found in the Darwin Core, with addition documentation and recommendations on the website linked below. The outcome provides a framework and clear semantics for sharing and integrating biodiversity inventory data.
